Table S3: Harmonisation of key outcome measures and their assessment across trials

Data element	Harmonisation strategy
Baseline characteristics	For FIDELIO-DKD and FIGARO-DKD, SGLT2 inhibitor use was defined by the presence of pre-specified WHO-DD drug record numbers in participants with concomitant medications ongoing at baseline. For FIND-CKD, SGLT2 inhibitor use is defined via the stratification factor baseline SGLT2 inhibitor use (N/Y).
Efficacy endpoint: Composite kidney outcome	The primary endpoint in FIDELIO-DKD was time to first onset of kidney failure, sustained $\geq 40\%$ decrease in eGFR from baseline over ≥ 4 weeks, or death from kidney causes; this was a secondary endpoint in FIGARO-DKD. Data are available from these trials for calculation of this endpoint with a sustained eGFR decrease of $\geq 57\%$ instead of $\geq 40\%$, as demonstrated in the FIDELITY analysis, where this was the main kidney composite outcome. In FIND-CKD, one of the key secondary endpoints was a composite of kidney failure or sustained $\geq 57\%$ decrease in eGFR from baseline. Kidney failure was defined as ESKD or a sustained decrease in eGFR to less than 15 mL/min per 1.73 m ² . ESKD was defined as initiation of dialysis (for ≥ 90 days in FIDELIO-DKD and FIGARO-DKD; for ≥ 30 days in FIND-CKD) or kidney transplantation. Kidney outcomes were adjudicated by independent clinical events committees in FIGARO-DKD and FIDELIO-DKD, but not in FIND-CKD. The INFINITY composite kidney outcome was a sustained $\geq 57\%$ decline in eGFR or kidney failure. Additional analyses included two kidney composite outcomes in which sustained ≥ 40 and $\geq 50\%$ declines in eGFR were substituted for a $\geq 57\%$ decline as a component of the composite kidney outcome. Kidney failure alone was also assessed.
Efficacy endpoint: Composite CV outcome	The composite CV outcome in both FIDELIO-DKD (where it was a secondary endpoint) and FIGARO-DKD (where it was a primary endpoint) was time to CV death (including undetermined death), non-fatal MI, non-fatal stroke, or HHF. In FIND-CKD, a composite CV outcome was included as a key secondary endpoint and was defined as HHF or CV death (excluding undetermined death). CV outcomes were adjudicated in FIDELIO-DKD and FIGARO-DKD but not in FIND-CKD. In INFINITY, the main cardiovascular composite outcome was HHF or CV death (excluding undetermined death). Additional CV outcomes included: (1) new-onset atrial fibrillation; (2) a composite of non-fatal MI, non-fatal stroke, HHF, or CV death (excluding undetermined death); (3) HHF; (4) all-cause hospitalisation; (5) CV death (excluding undetermined death); and (6) all-cause death.
Efficacy endpoint: Composite kidney–CV outcome	FIDELIO-DKD and FIGARO-DKD included key composite CV and kidney outcomes (defined above). FIND-CKD specified a composite kidney–CV outcome of kidney failure sustained $\geq 57\%$ decrease in eGFR from baseline, HHF, or CV death (excluding undetermined death). The INFINITY composite kidney–CV outcome was time to kidney failure, sustained $\geq 57\%$ decrease in eGFR from baseline over ≥ 4 weeks, HHF or CV death (excluding undetermined death), in line with FIND-CKD.
Stratification factors for efficacy models	In the FIDELIO-DKD and FIGARO-DKD trials, stratified Cox models have been applied with stratification factors history of CV disease (FIGARO-DKD only), region, eGFR category at screening, and type of albuminuria at screening fitted. Subgroups were investigated based on hazard ratios which were calculated separately for each subgroup category. Interaction p-values were generated based on stratified Cox models including the subgroup covariate and the respective interaction with treatment using a Wald test. In INFINITY, stratified Cox models were applied with stratification factors study, baseline SGLT2 inhibitor (N/Y) and UACR at screening (≤ 1000 mg/g vs >1000 mg/g). Subgroups (including study) were investigated using stratified Cox models across subgroup categories. Interaction p-values were generated based on stratified Cox models including subgroup covariate and the respective interaction with treatment using a Wald test.
eGFR	CKD-EPI 2009 equation (race-adjusted) was applied in all three trials and in INFINITY.
Estimand strategy	In all three trials and in INFINITY, the treatment policy strategy was applied to account for the intercurrent event treatment discontinuation and the while alive strategy for the intercurrent event of (non-CV) death.
Adverse events	In FIDELIO-DKD, FIGARO-DKD, and FIND-CKD, adverse events that started or worsened after the first dose of study intervention up to 3 days after any temporary or permanent interruption of study intervention were considered as treatment-emergent.

CKD=chronic kidney disease. CV=cardiovascular. eGFR=estimated glomerular filtration rate.

HHF=hospitalisation for heart failure. MI=myocardial infarction. SGLT2=sodium-glucose cotransporter 2.

Negative values indicate NNH. Placebo population event rates are the numbers of events per 1000 PY in the placebo groups of all trials in the relevant subpopulation. For outcomes in which no heterogeneity by diabetes status was observed, the overall relative treatment effect was applied to baseline event rates in the placebo arm. When evidence of interaction by diabetes status was present, diabetes-specific relative treatment effects were applied to the corresponding placebo event rates within each subgroup. Numbers needed to treat/harm not calculated for AKI since no effect was observed on this outcome. *The composite kidney outcome[†], or heart failure hospitalisation or cardiovascular death. [†]Sustained $\geq 57\%$ decline in eGFR relative to baseline or kidney failure. Kidney failure was defined as sustained eGFR <15 mL/min/1·73 m² or initiation of chronic dialysis or kidney transplantation. [‡]Heart failure hospitalisation or cardiovascular death. Cardiovascular death in this analysis excluded deaths classified as undetermined. AKI=acute kidney injury. CV=cardiovascular. eGFR=estimated glomerular filtration rate. HR=hazard ratio. NNH=number needed to harm. NNT=number needed to treat. PY=patient-years. UACR=urinary albumin-to-creatinine ratio.
